

Diageo has 5 large distilleries in India that manufactures all its products.

Diageo is looking at digitalizing the complete Distillery Process for Whiskey production. As a part of this initiative we are looking at acquiring digital solutions to continuously monitor the fermentation process and report the results.

Desired solution performance:

- **Coverage:** The solution should be able to determine the physical as well chemical properties of the wort. This would include Caustic Concentration, Yeast (Count, Culture etc), Temperature, Specific Gravity, pH, Alcohol by volume, various acid and mineral levels.
- **Methodology:** Solution to continuously monitor the quality of fermentation is preferred.
- **Data and Integration:** The solution should be able to capture information regarding the batch being processed and other manually measured parameters of the fermentation process. Quality check results should be displayed on the shop floor through standard monitors and alerts should be raised when the parameters are out of range. The results should also be transmitted to other IT systems (ERP/BI etc.) on a continuous basis or on need basis.

How to Apply?

1. After logging in, please click on [this link](#) and click Apply

You will be redirected to Confirm Company Details page

2. Please fill all necessary details and click Next.

3. If you wish to upload any document, please click on **Add Attachment** 
4. Click Next and answer all mandatory questions
5. Click APPLY on RFI Page to Submit your response, at the end of the Window.

Please ensure your profile completion is at least 85% for us to evaluate you.
